

PulseMetrics Monitoring Service Documentation

Internal reference documentation for the PulseMetrics infrastructure monitoring service. This document contains two dated revisions of the same API section, provided for extraction and contradiction-detection testing purposes.

Authentication and Configuration

Version 1.0 — Released January 2025

The PulseMetrics API requires an API key for authentication on all endpoints. The API key must be included as a query parameter named `apikey`. PulseMetrics issues API keys through the account settings page. The account settings page is managed by the PulseMetrics Billing team.

PulseMetrics retains raw metric data for 30 days on the standard plan. PulseMetrics retains raw metric data for 13 months on the enterprise plan. Aggregated metric data is retained indefinitely on all plans. Metric data is stored in a time-series database called PulseStore.

The default alert threshold for CPU usage is 85 percent. The default alert threshold for memory usage is 90 percent. Alerts are delivered through the PulseMetrics notification service. The notification service supports email and Slack as delivery channels.

PulseMetrics exports data in JSON format by default. The export endpoint supports a maximum of 10000 data points per request. PulseMetrics integrates with Datadog for cross-platform dashboards. The Datadog integration was built by the PulseMetrics Partnerships team.

Authentication and Configuration

Version 2.0 — Released May 2026

The PulseMetrics API requires an API key for authentication on all endpoints. The API key must be included in the X-API-Key request header. PulseMetrics issues API keys through the account settings page. The account settings page is now managed by the PulseMetrics Platform team.

PulseMetrics retains raw metric data for 14 days on the standard plan. PulseMetrics retains raw metric data for 24 months on the enterprise plan. Aggregated metric data is retained indefinitely on all plans. Metric data is stored in a time-series database called ChronosDB.

The default alert threshold for CPU usage is 75 percent. The default alert threshold for memory usage is 80 percent. Alerts are delivered through the PulseMetrics notification service. The notification service now supports email, Slack, and PagerDuty as delivery channels.

PulseMetrics exports data in Parquet format by default. The export endpoint supports a maximum of 50000 data points per request. PulseMetrics integrates with Grafana for cross-platform dashboards. The Grafana integration was built by the PulseMetrics Platform team.
